GBD Data Input Source Tool Guide

This document is intended to serve as a basic guide for using the Global Burden of Disease (GBD) Data Input Sources Tool. The tool lets you explore GBD 2019 input sources by GBD component, geography, and cause, risk, covariate, or impairment. After you have made your selection, you can view and access catalog entries for input sources used by GBD through the Global Health Data Exchange (GHDx).

You can download these input sources as a CSV file to see more information about how they were used in the analysis of the GBD. This CSV file contains metadata about the input sources as suggested in the [Guidelines for Accurate and Transparent Health Estimates Reporting \(GATHER\)](#), a statement that promotes best practices in reporting health estimates.

Accessing the tool

Access the tool through any Internet browser at <http://ghdx.healthdata.org/gbd-2019/data-input-sources>.

Section 1: Forming a query

Begin by selecting either a GBD component or a geography from the **Components** or **Locations** drop-down menu. The tool does not allow downloads for “All GBD components” or “Global.”

Options for GBD components are:

- All GBD
 - Mortality and Population
 - Mortality
 - Fertility
 - Population
 - Causes of Death and Disability
 - Causes of Death
 - Nonfatal Health Outcomes
 - Risk Factors
 - Covariates
 - UHC

Location options are all locations in the standard GBD reporting hierarchy, including regions and some subnational locations.

Depending on the GBD component you select, you are given options to refine your query by cause, impairment, risk, or covariate. You can refine by geography at any time.

Click the **submit query** button to generate a set of results.

Section 2: Global Health Data Exchange (GHDx) results

After you submit a query, you will see an alphabetical list of the input sources used for the part of GBD you specified. Clicking on a title of any of these citations brings you to the GHDx record for the source, which contains metadata describing the source, including geography, time period, data type, citation, and topics covered by the dataset.

Whenever possible, the GHDx record includes a link to where the data can be freely downloaded, registered for, or requested from the provider. For more about the GHDx, visit [About the GHDx](#).

Section 3: Downloading citations

To get a simple list of unique citations for the input sources generated by your query, click the **citation download** button. This will export a CSV file of only citations.

Section 4: Downloading results

Once the list of input sources for your query has been retrieved, you have the option to download a full result set. A full result set provides citations, but also a large array of other GATHER-recommended metadata that illustrate how input sources were used in GBD analysis. In a result set, a single input source may be represented by multiple rows in a CSV download: one for each location, age group, sex, etc. for which the source was used.

Click on the **download** button to begin the download process for *relatively* small result sets.

Even for small result sets, collating results in all dimensions for a set of input sources can take some time. The download page will remain active as your downloads are prepared. When they are prepared, the files, if there are more than one, will appear sequentially on the download page.

Note: If you plan to download the full results of your query, it is recommended that you make the narrowest selection possible. Because the download represents the use of input data at essentially the data point level, many result sets can be millions of rows.

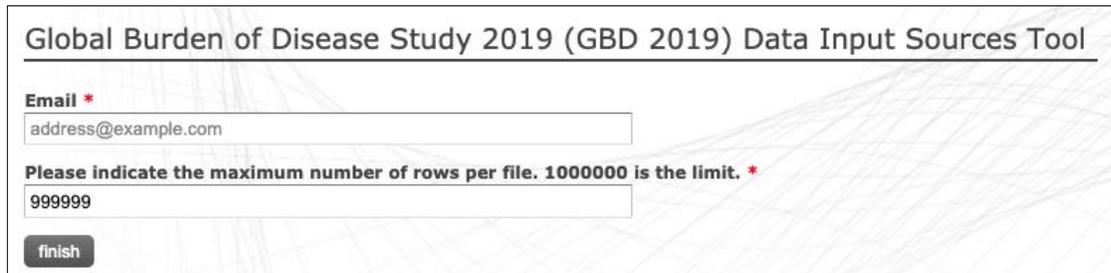

Section 5: Large results

Queries can produce very large result sets. In these cases, the download button will be greyed out.

The screenshot shows a web interface with three dropdown menus: 'Locations' (United States of America), 'Causes' (Neoplasms), and 'Impairments' (Impairments). Below these are four buttons: 'submit query', 'download', 'email download', and 'citation download'. The 'download' button is greyed out. A message at the bottom reads: 'THIS IS A LARGE RESULT SET, SO THE DOWNLOAD BUTTON ABOVE HAS BEEN DISABLED'.

The tool requires an email address and your choice of how many rows you want per file. The maximum number of rows for a single file is 1 million. This number determines the number of files your download returns, not the number of total results in that download.

The screenshot shows the 'Global Burden of Disease Study 2019 (GBD 2019) Data Input Sources Tool' interface. It features an 'Email *' field with the placeholder 'address@example.com', a 'Please indicate the maximum number of rows per file. 1000000 is the limit. *' field with the value '999999', and a 'finish' button.

A large request may take up to several hours to complete. You receive a confirmation email with a link to a page where you may check the status of your request. When the process is complete, that page contains the files' download links. You receive a second email confirming that your download is ready.

Section 6: CSV content

While the GHDx results contain metadata on the dataset itself, the CSV generated from your query includes additional information about the way the dataset was used in producing GBD estimates. Below is a description of what the columns in the CSV represent.

Column Header	Description
Citation	Suggested citation for the input source
Component	GBD Component
Subcomponent	Additional information on what an input was used for in analysis (e.g., severity splits, risk exposure, etc.)
Location	Geographic location for which the input source was used
Cause	Cause, etiology, or impairment for which the input source was used (where relevant)
Risk	Risk for which the input source was used (where relevant)
Covariate	Covariate for which the input source was used (where relevant)
Sustainable Development Goal	SDG for which the input source was used (where relevant)
Publication status	Indication if the input source is unpublished or forthcoming (if blank, the input source is considered published)
Provider	Provider of the data (provided whenever possible except for scientific literature)
Provider URL	Web address where you can find or inquire about the input source
GHDx URL	Web address for the GHDx record of the input source
Secondary GHDx URL	<p>Web address for the GHDx record of the granular input source (where relevant)</p> <p>Note: In some cases, a large input source is cataloged at a granular level to increase transparency on what parts of the source were used. This is generally signified by a citation that says “as it appears in.” The secondary GHDx URL points you to catalog records for the more granular input source. For example, the WHO Mortality Database represents many country years of vital registration data, and each country year is documented by a separate GHDx catalog record.</p>
Data Collection Method	Information on the mechanism of data collection
Year Start	Starting year of the data derived from the input source
Year End	Ending year of the data derived from the input source
Sex	Sex of the population of the data derived from the input source
Age Start	Numerical value of starting age of the population of the data derived from the input source
Age End	Numerical value of ending age of the population of the data derived from the input source
Age Type	Unit of age values in previous columns (e.g., years, months, days)
Representativeness	Relevant quality of the population in the input source (e.g., nationally representative, representative of urban areas only, etc.)
Urbanicity Type	Urbanicity value of the population in the input source (e.g., urban, rural, etc.)
Population Representativeness Covariates	Other qualities of the population in the input source (where relevant and collected; see the code values and descriptions document on the tool homepage for value translation)
Sample Size	Sample size of data derived from input source
Sample Size Unit	Unit of sample size
Standard Error	Standard error of data derived from input source

Troubleshooting

This section includes workarounds for some of the known downloading issues with the GBD Data Input Source Tool.

Combining multiple CSV files

Sometimes, queries return data in multiple CSV files. Each file contains a segment of the data and has identical columns and a header row. Note that you cannot have more than 1 million rows in a CSV file. Combining results over one million rows requires use of another program such as Stata.

To combine multiple CSV files in Excel:

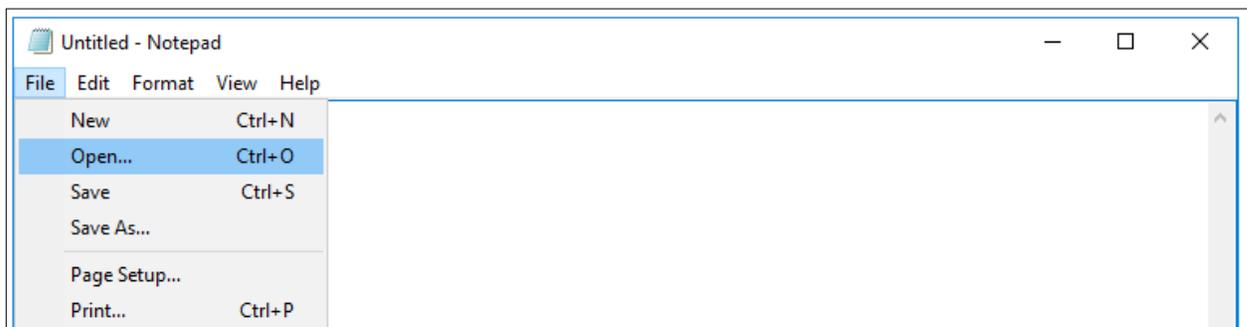

1. Open the first file in the set you want to combine in Excel.
2. Open the next file in the set.
3. Select all cells below the first line in this next file.
Note: A simple way to do this is to select cell A2 (the first and leftmost data-containing cell) and press the following keys: **Ctrl** + **Shift** + **↓** + **→**.
4. Copy the selected cells.
5. Paste the copied cells into the first and leftmost blank cell in the first file.
6. Repeat steps 2-5 until the data from all files has been copied into the first one.

Opening CSV files with special characters in Excel

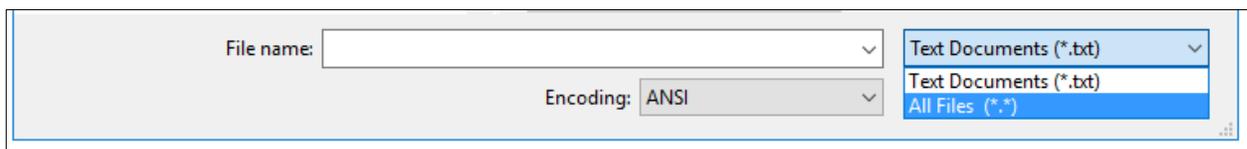

Sometimes, queries result in files that contain special characters, such as place names with accents like "México." These characters may not display properly when the CSV file is opened in Excel.

To solve this problem:

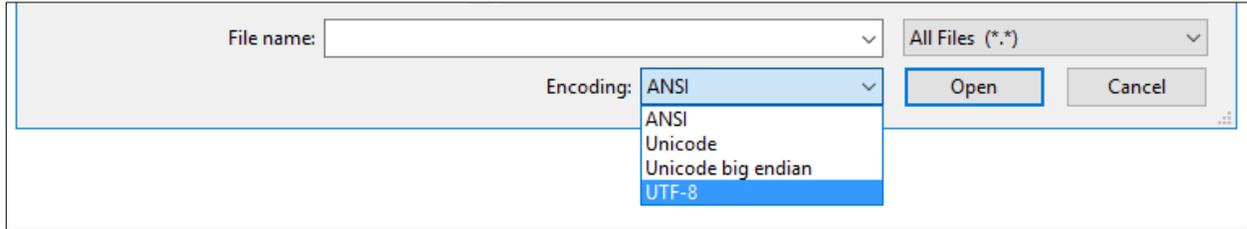

1. Open Notepad.
2. Click File > Open (Ctrl + O).

3. Browse to and open the exported CSV, making sure to select "All Files" in the bottom right.

4. In the Encoding drop-down menu at the bottom, change from ANSI to UTF-8.

5. Save the file. When you reopen it in Excel, the special characters should render correctly.
